# Valuation Inferno: Dante meets DCF... 

"Abandon every hope, ye who enter here"

Aswath Damodaran<br>www.damodaran.com

## Some Initial Thoughts

" One hundred thousand lemmings cannot be wrong"

## Graffiti

## Misconceptions about Valuation

- Myth 1: A valuation is an objective search for "true" value
- Truth 1.1: All valuations are biased. The only questions are how much and in which direction.
- Truth 1.2: The direction and magnitude of the bias in your valuation is directly proportional to who pays you and how much you are paid.
- Myth 2.: A good valuation provides a precise estimate of value
- Truth 2.1: There are no precise valuations
- Truth 2.2: The payoff to valuation is greatest when valuation is least precise.

■ Myth 3: . The more quantitative a model, the better the valuation

- Truth 3.1: One's understanding of a valuation model is inversely proportional to the number of inputs required for the model.
- Truth 3.2: Simpler valuation models do much better than complex ones.

## DCF Choices: Equity versus Firm

Firm Valuation: Value the entire business
by discounting eash flow to the firm at cost
of capital

Equity valuation: Value just the equity claim in the business by discounting cash flows to equity at the cost of equity

## The Value of a business rests on...

## C ashflows can be <br> a. After debt payments to equity <br> - Dividends <br> - Free Cashflow to Equity <br> b. Before debt payments to firm <br> - Free Cashflolw to Firm

Growth rate can be
a. In Equity Eamings

- Net Income
- Eamings per share
b. In Operating Eamings

Firm is in stable growth which it can sustain forever

Present value is
a. Value of equity, if cashflows to equity discounted at cost of equity
b. Value of operating assets of the firm, if cshflows to firm discounted at the cost of capital

## DISCOUNTED CASHFLOW VALUATION

## The nine circles of valuation hell.. With a special bonus circle...

## Illustration 1: Base Year fixation....

- You are valuing Exxon Mobil, using data from the most recent fiscal year (2008). The following provides the key numbers:

| Revenues | $\$ 477$ billion |
| :--- | :--- |
| EBIT $(1-\mathrm{t})$ | $\$ 58$ billion |
| Net Cap Ex | $\$ 3$ billion |
| Chg WC | $\$ 1$ billion |
| FCFF | $\$ 54$ billion |

- The cost of capital for the firm is $8 \%$ and you use a very conservative stable growth rate of $2 \%$ to value the firm. The market cap for the firm is $\$ 330$ billion and it has $\$ 10$ billion in debt outstanding.
a. How under or over valued is the equity in the firm?
b. Would you buy the stock based on this valuation? Why or why not?

## Normalization... not easy to do... but you don' thave a choice...

## And one possible response...

Step 1: Look at history

Step 2: Look for relationship
Regression of Exxon income against oil price Op Inc $=-6,934+911$ (Price per barrel of oil) $R$ squared $=94 \%$

## Illustration 2: Taxes and Value

- Assume that you have been asked to value a company and have been provided with the most recent year's financial statements:
EBITDA 140
- DA 40

EBIT 100

- Interest exp 20

Taxable income 80
Taxes 32
Net Income 48

## Free Cash flow to firm <br> EBIT (1- tax rate) <br> -(Cap Ex - Depreciation) <br> - Change in non-cash WC <br> =FCFF

Assume also that cash flows will be constant and that there is no growth in perpetuity. What is the free cash flow to the firm?
a) 88 million (Net income + Depreciation)
b) 108 million (EBIT - taxes + Depreciation)
c) 100 million (EBIT ( 1 -tax rate) + Depreciation)
d) 60 million (EBIT (1- tax rate))
e) 48 million (Net Income)
f) 68 million (EBIT - Taxes)

## Illustration 3: High Growth for how long...

```
Assume that you are valuing a young, high growth firm with great potential, just after its initial public offering. How long would you set your high growth period?
- < 5 years
- 5 years
- 10 years
- \(>10\) years
```

## Reasons to be cautious..

## Growth fades quickly

The New York Times

## And does not scale up easily

## Illustration 4: The Cost of Capital

- The cost of capital for Chippewa Technologies, a US firm with $20 \%$ of its revenues from Brazil, has been computed using the following inputs:

## 4.1: What is the riskfree rate?

When we use the T.Bond rate as a riskfree rate, we are assuming that there is no default risk in the US treasury. Is that reasonable? What if it is not?

- The Indian government had 10-year Rupee bonds outstanding, with a yield to maturity of about $8 \%$ on April 1, 2010. In January 2010, the Indian government had a local currency sovereign rating of Ba 2 . The typical default spread for Ba 2 rated country bonds in early 2010 was $3 \%$.
- The riskfree rate in Indian Rupees is
a) The yield to maturity on the 10 -year bond (8\%)
b) The yield to maturity on the 10 -year bond + Default spread $(8 \%+3 \%=11 \%)$
c) The yield to maturity on the 10 -year bond - Default spread $(8 \%-3 \%=5 \%)$
d) None of the above

## 4.2: Don't let your macro views color your valuation

- If you believe that interest rates will go up (down), that exchange rates will move adversely (in your favor) and that the economy will weaken (strengthen), should you try to bring them into your individual company valuations?
- Yes
- No

■ If you do, and you conclude that a stock is overvalued (undervalued), how should I read this conclusion?

## 4.3: Betas do not come from regressions..

<HELP> for explanation, 〈MENU> for similar functions.

## And cannot be trusted even when they look good...

```

## Determinants of Betas

## Bottom Up Beta Estimates for Tata Companies

|  | Tata Chemicals | Tata <br> Steel | Tata Motors | TCS |
| :--- | :---: | :---: | :---: | :---: |
| Business <br> breakdown |  <br> Fertilizers | Steel | Automobiles |  <br> Information Processing |
| Unlevered beta | 0.94 | 1.23 | 0.98 | 1.05 |
| D/E Ratio | $43.85 \%$ | $42.03 \%$ | $33.87 \%$ | $0.03 \%$ |
| Levered Beta | 1.21 | 1.57 | 1.20 | 1.05 |

A closer look at Tata Chemicals

|  | \% of revenues | Unlevered Beta |
| :--- | :---: | :---: |
| Chemicals | $42 \%$ | 1.05 |
| Fertilizers | $58 \%$ | 0.86 |
| Company |  | 0.94 |

### 4.4. And equity risk premiums matter...

|  | Arithmetic Average |  | Geometric Average |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Stocks - T. Bills | Stocks - T. Bonds | Stocks - T. Bills | Stocks - T. Bonds |
| $1928-2010$ | $7.62 \%$ | $6.03 \%$ | $5.67 \%$ | $4.31 \%$ |
|  | $2.25 \%$ | $2.38 \%$ |  |  |
| $1961-2010$ | $5.83 \%$ | $4.13 \%$ | $4.44 \%$ | $3.09 \%$ |
|  | $2.42 \%$ | $2.69 \%$ |  |  |
| $2001-2010$ | $1.37 \%$ | $-2.26 \%$ | $-0.79 \%$ | $-4.11 \%$ |
|  | $6.73 \%$ | $9.00 \%$ |  |  |

Historical premium

In 2010, the actual cash returned to stockholders was 53.96. That was up about 30\% from 2009 levels.

Analysts expect earnings to grow $13 \%$ in 2011, $8 \%$ in 2012,6\% in 2013 and $4 \%$ therafter, resulting in a compounded annual growth rate of $6.95 \%$ over the next 5 years. We will assume that dividends \& buybacks will tgrow $6.95 \%$ a year for the next 5 years.

After year 5, we will assume that earnings on the index will grow at $3.29 \%$, the same rate as the entire economy (= riskfree rate).

S\&P 500 is at 1257.64
Adjusted Dividends \&
Buybacks for $2010=53.96$
$\begin{array}{ll}\text { Expected Return on Stocks (1/1/11) } & =8.49 \% \\ \text { T.Bond rate on } 1 / 1 / 11 & =3.29 \% \\ \text { Equity Risk Premium }=8.03 \%-3.29 \% & =5.20 \%\end{array}$

Data Sources:
Dividends and Buybacks last year: S\&P Expected growth rate: News stories, Yahoo! Finance, Zacks

Equity risk premiums change over long periods... And so do default spreads...

Equity Risk Premiums and Bond Default Spreads

## And sometimes over short time periods: 9/12/2008 12/31/2008

Implied Equity Risk Premium - 9/12-12/31/08

## Implied Premium for Sensex: April 2010

- Level of the Index $=17559$
- FCFE on the Index $=3.5 \%$ (Estimated FCFE for companies in index as \% of market value of equity)
- Other parameters
- Riskfree Rate = 5\% (Rupee)
- Expected Growth (in Rupee)
- Next 5 years $=20 \%$ (Used expected growth rate in Earnings)
- After year $5=5 \%$
- Solving for the expected return:
- Expected return on Equity $=11.72 \%$
- Implied Equity premium for India $=11.72 \%-5 \%=6.72 \%$

## 4.5: Small Cap and other premiums: The perils of the Buildup Approach

- While it has become conventional practice to estimate and use small cap, liquidity and other premiums, when computing cost of equity, it is a dangerous practice because:

1. These premiums are derived from historical data and come with very large standard errors. For instance, the standard error on the small cap premium estimated over the last 80 years is close to $2 \%$...
2. If small firms are riskier than large firms, we should consider the source of that risk - niche products, high operating leverage... - and build it in, rather than accept a fixed premium for all small firms.
3. Small firms become larger as they grow over time.. Small cap premiums should be year-specific.
4. The danger of double counting risk grows as we add more premiums - small cap, private business and illiquidity are overlapping issues, not independent ones.

## 4.6: With globalization of revenues... globalization of risk

Proposition 1: There is more risk in operating in some countries than in others and the risk premium should reflect this additional risk. One approach to estimating this additional risk premium is to do the following:

- Start with the default spread for the country in question
- Scale up the default spread to reflect the additional risk of equity Country Risk Premium $=$ Default Spread $*\left(\sigma_{\text {Equity }} / \sigma_{\text {Government Bond }}\right)$ Country Risk Premium Brazil $=2.00 \% ~(33 \% / 22 \%)=3.00 \%$
Proposition 2: Risk comes from your operations and not your country of incorporation. Developed market companies can be heavily exposed to emerging market risk, just as emerging market companies can find ways to reduce their exposure to emerging market risk. One simple proxy is to look at the revenues generated in a country, relative to the average company in that market.
- Proportion of Chippewa' s revenues from Brazil $=20 \%$
- Average Brazilian company's revenues from Brazil $=77 \%$

Lambda $_{\text {Chippewa }}=20 \% / 77 \%=.26$

## Estimating lambdas: Tata Group

|  | Tata Chemicals | Tata Steel | Tata Motors | TCS |
| :---: | :---: | :---: | :---: | :---: |
| \% of production/ operations in India | High | High | High | Low |
| \% of revenues in India | 75\% | 88.83\% | 91.37\% | 7.62\% |
| Lambda | 0.75 | 1.10 | 0.80 | 0.20 |
| Other factors | Gets $77 \%$ of its raw material from nondomestic sources, |  | Recently acquired Jaguar/Land Rover, with significant nondomestic sales | While its operations are spread all over, it uses primarily Indian personnel |

## 4.7: Debt and the Cost of debt

- As a general rule, it is better to use narrow definitions of debt, when it comes to the debt in the cost of capital computation. Including nebulous items in debt will just inflate the debt ratio, lower the cost of capital and make the firm look more valuable than it really is.
- The cost of debt is the rate at which the firm can borrow long term, today. The current book interest rate (interest expense/ book debt) is almost always useless for this purpose because it includes old debt, short term debt and items that should not be even be considered as debt.
■ The cost of debt is best estimated by looking at the firm's current financial ratios and assessing how much a lender would charge to lend them money, long term:
Cost of debt $=$ Riskfree rate + Default spread on debt
- Since interest saves you taxes at the margin, the tax rate used should be the marginal tax rate and not the effective tax rate.

## The Correct Cost of Capital for Chippewa

| Input | What was used... | What should have been used.... |
| :---: | :---: | :---: |
| Riskfree rate | Normalized riskfree rate = 5\% | Actual riskfree rate = 3\% |
| Beta | Bloomberg adjusted beta $=1.20$ | Sector average adjusted beta $=1.60$ |
| Equity Risk Premium | Ibbotson Historical premium = 5\% | Current implied equity risk premium = 4.5\% |
| Other adjustments to cost of equity | Small firm premium $=3 \%$ | No small firm premium <br> Country risk premium $\begin{aligned} & =\text { Lambda * Brazil Country Risk Premium } \\ & =0.26 * 3 \%=0.78 \% \end{aligned}$ |
| Cost of equity | $5 \%+1.20$ (5\%) + 3\% = 14\% | $3 \%+1.60$ (4.5\%) $+0.78 \%=10.98 \%$ |
| Cost of debt (pre-tax) | Book interest rate $=3 \%$ | Cost of debt based on synthetic rating $=3 \%+3.5 \%=6.5 \%$ |
| Tax rate | Effective tax rate $=30 \%$ | Marginal tax rate $=40 \%$ |
| Debt ratio | Book ratio: <br> Liabilities $=50 \%$ and Equity $=50 \%$ | Market debt ratio <br> Equity $=70 \%$ and Debt $=30 \%$ |
| Cost of capital | 14\% (.5) + 3\% (1-.3) (.5) = 8.05\% | 10.98\% (.7) + 6.5\% (1-.4) (.3) = 8.72\% |

## Estimating Cost of Capital: Tata Group

|  | Tata Chemicals | Tata Steel | Tata Motors | TCS |
| :--- | :---: | :---: | :---: | :---: |
| Beta | 1.21 | 1.57 | 1.20 | 1.05 |
| Lambda | 0.75 | 1.10 | 0.80 | 0.20 |
| Cost of equity | $13.82 \%$ | $17.02 \%$ | $14.00 \%$ | $10.63 \%$ |
|  |  |  |  |  |
| Synthetic rating | BBB | A | B+ | AAA |
| Cost of debt | $6.60 \%$ | $6.11 \%$ | $8.09 \%$ | $5.61 \%$ |
| Debt Ratio | $30.48 \%$ | $29.59 \%$ | $25.30 \%$ | $0.03 \%$ |
|  |  |  |  |  |
| Cost of Capital | $11.62 \%$ | $13.79 \%$ | $12.50 \%$ | $10.62 \%$ |

Tata Chemicals: Divisional Costs of Capital

|  | Beta | Cost of <br> equity | Cost of <br> debt | Debt <br> Ratio | Cost of <br> capital |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Chemicals | 1.35 | $14.47 \%$ | $6.60 \%$ | $30.48 \%$ | $12.07 \%$ |
| Fertilizers | 1.11 | $13.37 \%$ | $6.60 \%$ | $30.48 \%$ | $11.30 \%$ |

## Illustration 5: The price of growth...

- You are looking at the projected cash flows provided by the management of the firm, for use in valuation

| Year | Current | 1 | 2 | 3 | 4 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Growth rate |  | $10 \%$ | $10 \%$ | $10 \%$ | $10 \%$ |
| Revenues | $\$ 100.00$ | $\$ 110.00$ | $\$ 121.00$ | $\$ 133.10$ | $\$ 146.41$ |
| EBIT $(1-\mathrm{t})$ | $\$ 30.00$ | $\$ 33.00$ | $\$ 36.30$ | $\$ 39.93$ | $\$ 43.92$ |
| + Depreciation | $\$ 15.00$ | $\$ 16.50$ | $\$ 18.15$ | $\$ 19.97$ | $\$ 21.96$ |
| - Cap Ex | $\$ 18.00$ | $\$ 19.80$ | $\$ 21.78$ | $\$ 23.96$ | $\$ 26.35$ |
| - Chg in WC | $\$ 3.00$ | $\$ 3.30$ | $\$ 3.63$ | $\$ 3.99$ | $\$ 4.39$ |
| FCFF | $\$ 24.00$ | $\$ 26.40$ | $\$ 29.04$ | $\$ 31.94$ | $\$ 35.14$ |

a. How do you check to see if top-line growth is feasible?
b. How do you ensure that the forecasts are internally consistent? (In other words, are all of the other forecasted numbers consistent with the growth forecast in revenues?)

## You be the judge: Good Growth or Bad Growth

|  | Tata <br> Chemicals | Tata Steel | Tata <br> Motors | TCS |
| :--- | ---: | :---: | :---: | :--- |
| ROC | $10.35 \%$ | $13.42 \%$ | $17.16 \%$ | $40.63 \%$ |
| Cost of capital | $11.62 \%$ | $13.79 \%$ | $12.50 \%$ | $10.62 \%$ |
| Reinvestment rate | $56.50 \%$ | $38.09 \%$ | $70 \%$ | $56.73 \%$ |
| Sustainable growth | $5.85 \%$ | $5.11 \%$ | $12.01 \%$ | $23.05 \%$ |

## Illustration 6: The "fixed debt ratio" assumption

- You have been asked to value Hormel Foods, a firm which currently has the following cost of capital:
Cost of capital $=7.31 \%(.9)+2.36 \%(.1)=6.8 \%$
a. You believe that the target debt ratio for this firm should be $30 \%$. What will the cost of capital be at the target debt ratio?
b. Which debt ratio (and cost of capital) should you use in valuing this company?

## 6.1: Cost of Capital and Debt Ratios Hormel Foods in 2009

As debt increases, your cost of equity should go up. Levered Beta $=$ Unlevered beta (1+(1-t) (D/E))

As debt increases, interest expenses will go up more than proportionately. Holding operating income constant, coverage ratios decrease and ratings fall.

## 6.2: Changing Debt Ratios and Costs of Capital over time Las Vegas Sands

| Year | Beta | Cost of equity | Pre-tax Cost of debt | Debt Ratio | Cost of capital |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 3.14 | $21.82 \%$ | $9.00 \%$ | $73.50 \%$ | $9.88 \%$ |
| 2 | 3.14 | $21.82 \%$ | $9.00 \%$ | $73.50 \%$ | $9.88 \%$ |
| 3 | 3.14 | $21.82 \%$ | $9.00 \%$ | $73.50 \%$ | $9.88 \%$ |
| 4 | 3.14 | $21.82 \%$ | $9.00 \%$ | $73.50 \%$ | $9.88 \%$ |
| 5 | 3.14 | $21.82 \%$ | $9.00 \%$ | $73.50 \%$ | $9.88 \%$ |
| 6 | 2.75 | $19.50 \%$ | $8.70 \%$ | $68.80 \%$ | $9.79 \%$ |
| 7 | 2.36 | $17.17 \%$ | $8.40 \%$ | $64.10 \%$ | $9.50 \%$ |
| 8 | 1.97 | $14.85 \%$ | $8.10 \%$ | $59.40 \%$ | $9.01 \%$ |
| 9 | 1.59 | $12.52 \%$ | $7.80 \%$ | $54.70 \%$ | $8.32 \%$ |
| 10 | 1.20 | $10.20 \%$ | $7.50 \%$ | $50.00 \%$ | $7.43 \%$ |

## Illustration 7: The Terminal Value

- The best way to compute terminal value is to
- Use a stable growth model and assume cash flows grow at a fixed rate forever
- Use a multiple of EBITDA or revenues in the terminal year
- Use the estimated liquidation value of the assets

You have been asked to value a business. The business expects to earn $\$ 120$ million in after-tax earnings (and cash flow) next year and to continue generating these earnings in perpetuity. The firm is all equity funded and the cost of equity is $10 \%$; the riskfree rate is $3 \%$ and the ERP is $7 \%$. What is the value of the business?

## 7.1: Limits to stable growth...

- Assume now that you were told that the firm can grow earnings at $2 \%$ a year forever. Estimate the value of the business.
- Now what if you were told that the firm can grow its earnings at $4 \%$ a year forever?

■ What if the growth rate were $6 \%$ a year forever?

## 7.2: And reinvestment to go with growth...

- To grow, a company has to reinvest. How much it will have to reinvest depends in large part on how fast it wants to grow and what type of return it expects to earn on the reinvestment.
- Reinvestment rate $=$ Growth Rate/ Return on Capital
- Assume in the previous example that you were told that the return on capital was $10 \%$. Estimate the reinvestment rate and the value of the business (with a $2 \%$ growth rate).
- What about with a 3\% growth rate?

## 7.3: And you may not make it to Nirvana...

- Traditional valuation techniques are built on the assumption of a going concern, i.e., a firm that has continuing operations and there is no significant threat to these operations.
- In discounted cashflow valuation, this going concern assumption finds its place most prominently in the terminal value calculation, which usually is based upon an infinite life and ever-growing cashflows.
- In relative valuation, this going concern assumption often shows up implicitly because a firm is valued based upon how other firms - most of which are healthy are priced by the market today.
■ When there is a significant likelihood that a firm will not survive the immediate future (next few years), traditional valuation models may yield an over-optimistic estimate of value.

## The Distress Factor

- In February 2009, LVS was rated B+ by S\&P. Historically, $\underline{28.25 \%}$ of B+ rated bonds default within 10 years. LVS has a $6.375 \%$ bond, maturing in February 2015 (7 years), trading at $\$ 529$. If we discount the expected cash flows on the bond at the riskfree rate, we can back out the probability of distress from the bond price:

$$
529=\sum_{\mathrm{t}=1}^{\mathrm{E}} \frac{63.75\left(1-\mathrm{p}_{\text {Distes }}\right)^{\mathrm{t}}}{(1.03)^{\mathrm{t}}}+\frac{1000\left(1-\mathrm{p}_{\text {Disteses }}\right)^{7}}{(1.03)^{7}}
$$

- Solving for the probability of bankruptcy, we get:

$$
\pi_{\text {Distress }}=\text { Annual probability of default }=13.54 \%
$$

- Cumulative probability of surviving 10 years $=(1-.1354)^{10}=23.34 \%$
- Cumulative probability of distress over 10 years $=1-.2334=.7666$ or $76.66 \%$

■ If LVS is becomes distressed:

- Expected distress sale proceeds $=\$ 2,769$ million $<$ Face value of debt
- Expected equity value/share $=\$ 0.00$

■ Expected value per share $=\$ 8.12(1-.7666)+\$ 0.00(.2334)=\$ 1.92$

## 8. From firm value to equity value: Loose Ends...

- For a firm with consolidated financial statements, you have discounted free cashflows to the firm at the cost of capital to arrive at a firm value of \$ 100 million. The firm has
- A cash balance of $\$ 15$ million
- Debt outstanding of $\$ 20$ million
- A 5\% holding in another company: the book value of this holding is $\$ 5$ million. (Market value of equity in this company is $\$ 200$ million)
- Minority interests of $\$ 10$ million on the balance sheet
a. What is the value of equity in this firm?
b. How would your answer change if you knew that the firm was the target of a lawsuit it is likely to win but where the potential payout could be $\$ 100$ million if it loses?
c. Now assume that you are considering acquiring the firm and are told that it is "normal" to pay a $20 \%$ control premium. Would you go along? Why or why not?

## 8.1: A discount for cash...

- The cash is invested in treasury bills, earning 3\% a year. The cost of capital for the firm is $8 \%$ and its return on capital is $10 \%$. An argument has been made that cash is a sub-optimal investment for the firm and should be discounted. Do you agree?
- Yes
- No
- If yes, what are the logical implications of firms paying dividends or buying back stock?
- If no, are there circumstances under which you would discount cash? How about attaching a premium?

## 8.2: Valuing Cross Holdings

- In a perfect world, we would strip the parent company from its subsidiaries and value each one separately. The value of the combined firm will be
- Value of parent company + Proportion of value of each subsidiary
- To do this right, you will need to be provided detailed information on each subsidiary to estimate cash flows and discount rates.
- With limited or unreliable information, you can try one of these approximations:
- The market value solution: When the subsidiaries are publicly traded, you could use their traded market capitalizations to estimate the values of the cross holdings. You do risk carrying into your valuation any mistakes that the market may be making in valuation.
- The relative value solution: When there are too many cross holdings to value separately or when there is insufficient information provided on cross holdings, you can convert the book values of holdings that you have on the balance sheet (for both minority holdings and minority interests in majority holdings) by using the average price to book value ratio of the sector in which the subsidiaries operate.

## Getting to equity value: Tata Companies

|  | Tata Chemicals | Tata Steel | Tata Motors | TCS |
| :--- | ---: | ---: | ---: | ---: |
| Value of Operating Assets | INR 57,129 | INR 501,661 | INR 231,914 | INR 1,355,361 |
| + Cash | INR 6,388 | INR 15,906 | INR 11,418 | INR 3,188 |
| + Value of Holdings | INR 56,454 | INR 467,315 | INR 140,576 | INR 66,141 |
| Value of Firm | INR 119,971 | INR 984,882 | INR 383,908 | INR 1,424,690 |
| - Debt | INR 32,374 | INR 235,697 | INR 109,198 | INR 505 |
| - Options | INR 0 | INR 0 | INR 0 | INR 0 |
| Value of Equity | INR 87,597 | INR 749,185 | INR 274,710 | INR 1,424,184 |
| Value per share | INR 372.34 | INR 844.43 | INR 665.07 | INR 727.66 |

## 8.3: No garnishing please... Control may have value... but is not always 20\%

Exhibit 7.2: The value of control at Hormel Foods
Hormel Foods sells packaged meat and other food products and has been in existence as a publicly traded company for almost 80 years. In 2008, the firm reported after-tax operating income of $\$ 315$ million, reflecting a compounded growth of $5 \%$ over the previous 5 years. The Status Quo
Run by existing management, with conservative reinvestment policies (reinvestment rate $=14.34 \%$ and debt ratio $=10.4 \%$.

New and better management
More aggressive reinvestment which increases the reinvestment rate (to 40\%) and length of growth (to 5 years), and higher debt ratio (20\%). perating Restructuring (1) Expected growth rate $=$ ROC ${ }^{*}$ Reinvestment Rate Expected growth rate (status quo) $=14.34 \%$ * $19.14 \%=2.75 \%$ Expected growth rate (optimal) $=14.00 \% * 40 \%=5.60 \%$ ROC drops, reinvestment rises and growth goes up.

Cost of capital = Cost of equity (1-Debt ratio) + Cost of debt (Debt ratio) Status quo $=7.33 \%(1-.104)+3.60 \%(1-.40)(.104)=6.79 \%$ Optimal $=7.75 \%(1-.20)+3.60 \%(1-.40)(.20)=6.63 \%$ Cost of equity rises but cost of capital drops.

## 9. From equity value to equity value per share

- You have valued the equity in a firm at $\$ 200$ million. Estimate the value of equity per share if there are 10 million shares outstanding.
- How would your answer change if you were told that there are 2 million employee options outstanding, with a strike price of $\$ 20$ a share and 5 years left to expiration?

## Value per share... as a function of stock price volatility and option maturity

## 10. The final circle of hell...
